Mucormycosis & Pythiosis – new insight

Ariya Chindamporn

Department of Microbiology, Faculty of Medicine,
Chulalongkorn University
Bangkok, Thailand

Outline

- Introduction
- Recent Taxonomy
- Trend of incidence
- Epidemiology between developed and developing countries
- Pathogenesis : role of CoH receptor agents –agents causing infection
- Treatment

PRESENTED AT MMTN CONFERENCE, 1-3 DEC 2017

Taxonomy of Fungi Causing Mucormycosis and Entomophthoramycesis (Zygomycosis) and Nomenclature of the Disease: Molecular Mycologic Perspectives

Kyung J. Kwon-Chung

Molecular Microbiology Section, Laboratory of Clinical Infectious Diseases, National Institute of Allergy and Infectious Diseases, National Institutes of Health, Bethesda, Maryland

A

Figure 1. Old (A) and a proposed new (B) classification schemes of the kingdom Fungi.

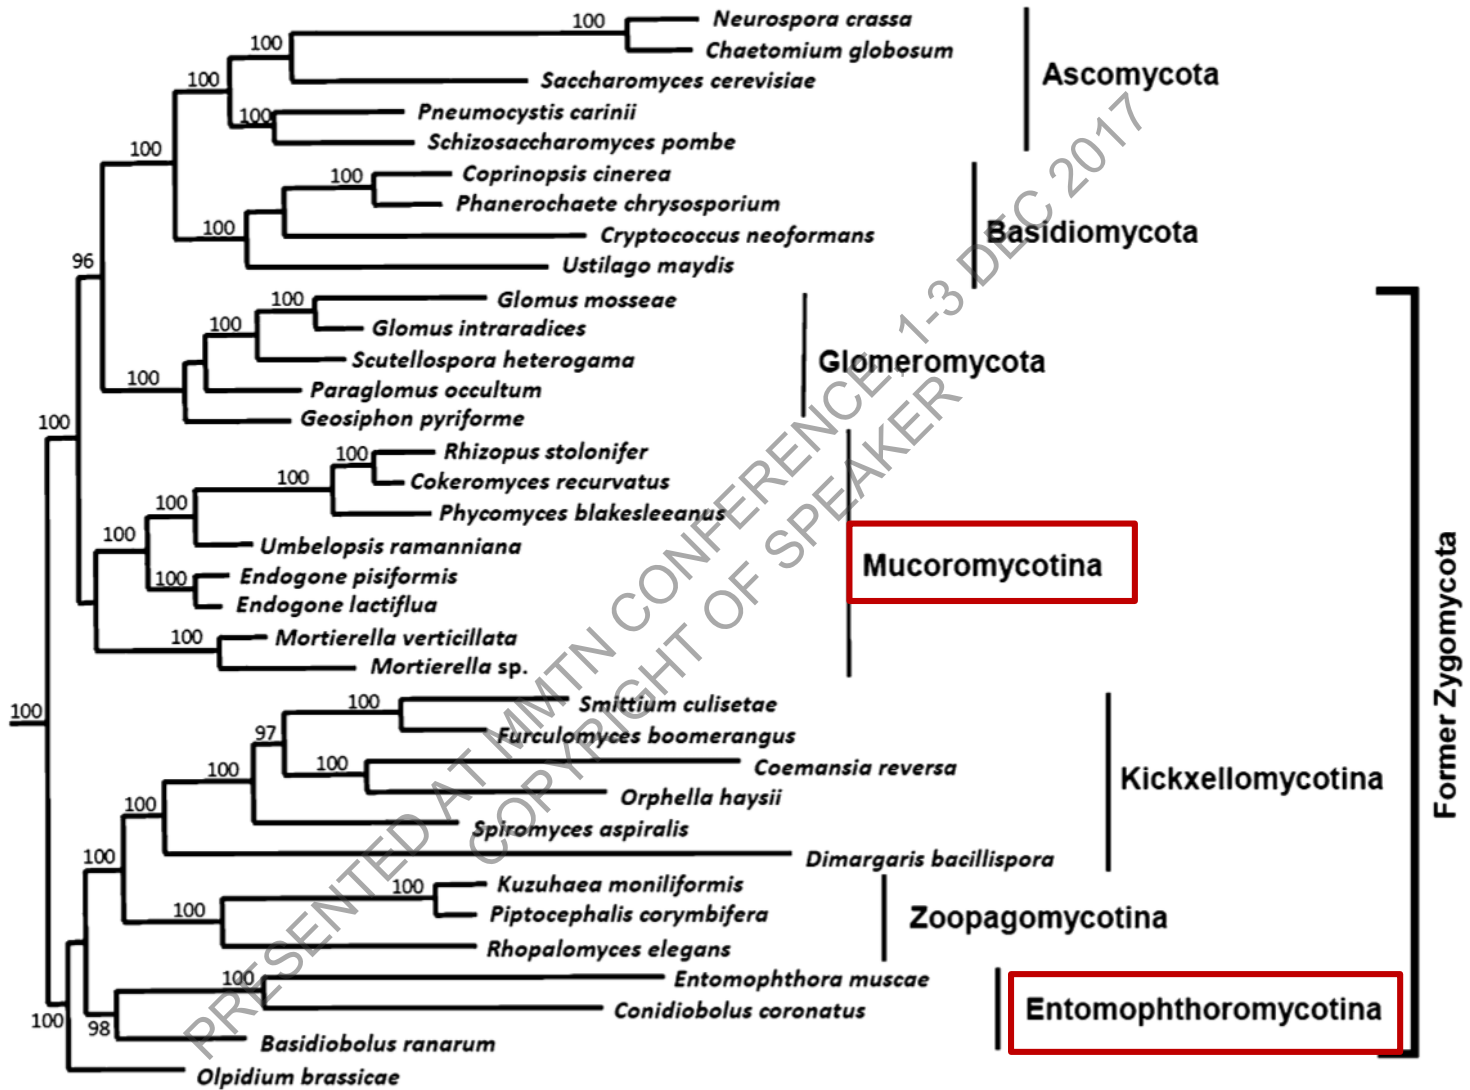

Figure 3. Phylogenetic tree provided by T. Y. James at the University of Michigan, Ann Arbor, which was based on unpublished results from the AFTOL (Assembling the Fungal Tree of Life) project [10]. Results are similar to those reported by James et al [5], but additional basal taxa are included.

Mucormycosis VS Entomophthoromycosis

	Mucormycosis	Entomophthoromycosis
Synonym	Phycomycosis, Zygomycosis	--
Infection - Host, mostly	Immunocompromised: HM, HSCT, SOT, Diabetic ketoacidosis	Immunocompetent
Clin. Manifestation	Sinus, Pulmonary, Cutaneous, GI, Acute thrombosis	<u>Chronic & Subcutaneous</u>
Treatment	AmphotericinB, posaconazole	Itraconazole
Route of infection	Inhalation, ingestion, or through direct inoculation via abraded skin	Abrasion
Pathogenic form	Aseptate hyphae 3-25 µm, thin wall, non dichotomous branching	Aseptate hyphae surround by thick eosinophilic sleeves
Habitat	Decaying organic substrate	Amphibians, GI of Lizard, decayed plant
Distribution	World wide	Tropical & Subtropical
Pathogen	Subphylum Mucoromycotina: Order Mucorales: <i>Rhizopus</i> , <i>Mucor</i> , <i>Lichtheimia (Absidia)</i> , etc.	Subphylum Entomophthoromycotina: Order Entomophthorales: <i>Basidiobolus</i> , <i>Conidiobolus</i>

Subcutaneous *Saksenaea vasiformis* infection presenting as disfiguring facial plaques

- 51 yr –old labourer
- 2 mo. painless mass, Normal nasal cavity & nasopharynxgeal mucosa
- History :
 - 4 mo. before: shallow abrasion
 - Abt & debridement – mass enlarged
 - No systemic symptom

AmB (1.2 mg/kg/d) & Itra (600 mg/d) 40 d.

Abdominal ⁺⁺	1 (0.5)	3 (10)	5 (1)
Cerebral ^{&}	1 (0.5)	0	2 (0.5)

IIR, Interquartile interval range.

^aMortality rate estimated with the available information of 246 individuals.

^bType of infection was estimated depending on the number of individuals with available information: 181 with diabetes mellitus and 31 with malignancy.

Although an overall estimation was possible for some variables among the 418 cases, in some reports only the site of infection was reported without mention of the underlying disease.

* Five individuals with malignancy had diabetes mellitus as comorbidity

** Includes cases without underlying condition or without diabetes and without malignancy (N = 39, 9.3%). This group had mortality rate in 52% (15/29). Ten individuals with no underlying condition (19/39, 49%) did not have information available and eight were reported as previously healthy. Prior trauma was present in eight of 39 (20%), of these five individuals had no other associated condition. Five individuals had autoimmune disease (5/39, 13%), three with HIV (human immunodeficiency virus) infection (3/39, 8%), other prior conditions were drug toxicity (2/39, 5%), post-surgery (2/39, 5%). Drug toxicities consisted in agranulocytosis or neutropenia due to drugs. Numbers reported in populations with diabetes and malignancy vary due to the availability of the information.

*** Unspecified: refers to information of the site/type of infection was unavailable

⁺2 or more sites affected.

⁺⁺Only abdominal infection. These were gastric, renal, hepatic, splenic, and intestinal presentation.

[&]Only due to trauma and postsurgical process, no sinus infection.

Literature review in Mexico 1982-2015

Table 6. Clinical isolates reported from 250 patients.

Organism isolated	Total population n = 250 (%)
<i>Rhizopus species</i>	148 (59)
<i>Rhizopus oryzae/R. arrhizus</i>	108/148 (73)
<i>Rhizopus sp.</i>	34/148 (23)
<i>Rhizopus rhizopodiformis</i>	2/148 (1.3)
<i>Rhizopus microsporus</i>	2/148 (1.3)
<i>Rhizopus azygosporus</i>	1/148 (0.6)
<i>Rhizopus pusillus</i>	1/148 (0.6)
<i>Mucor species</i>	71 (28)
<i>Mucor sp.</i>	66/71 (93)
<i>Mucor circinelloides</i>	5/71 (7)
<i>Rhizomucor sp.</i>	10 (4)
<i>Lichtheimia corymbifera</i>	8 (3)
<i>Cunninghamella sp.</i>	4 (1.5)
<i>Syncephalastrum racemosum</i>	3 (1)
<i>Basidiobolus sp.</i>	3 (1)
<i>Conidiobolus sp.</i>	1 (0.5)
<i>Apophysomyces mexicanus</i>	1 (0.5)
<i>Absidia sp.</i>	1 (0.5)

Cases of mucormycosis and entomophthoromycosis reported since 1982

Performance of Diagnostic Testing

Diag tool	nonspecialized center	specialized center	Total
Pos. Direct smear/cytology	73/76 (95%)	158/158 (100%)	231/234 (98%)
Pos. Culture	120/211 (57%)	142/158 (90%)	262/369 (71%)

- 158/369 (41%) cases were reported by a specialized center,
- 211 cases by non specialized center

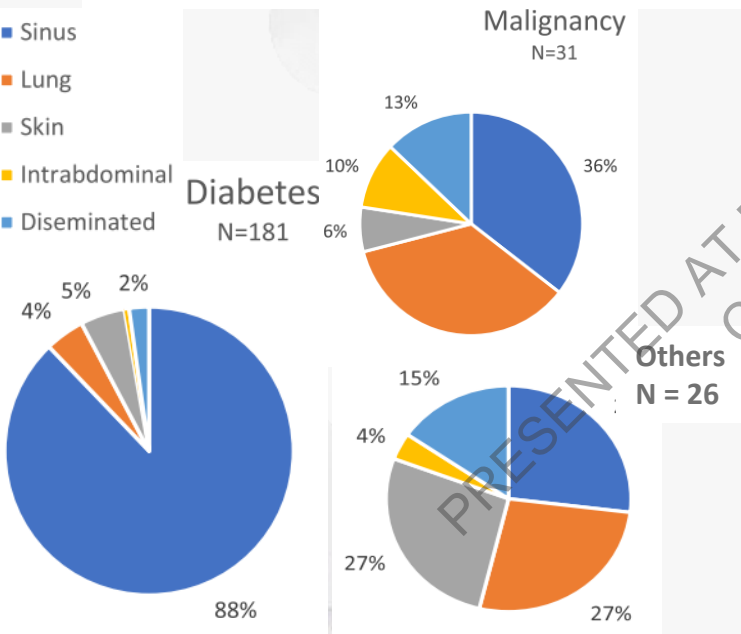

Figure 3. Clinical presentations of mucormycosis and entomophthoromycosis in Mexico. Pie charts showing the clinical presentations by underlying condition using proportions

Etiologic agents of Zygomycosis (Mucormycosis)

The data shown are from studies by Chakrabarti et al. , Mohapatra (India)., Skiada (Europe), Lanterniaer et al. (France), and Pagano et al. (Italy)

Laboratory Diagnosis

- Collect specimens : pus, bloody tissue, debris
- Transportation : Not on ice
- Processing :
 - Cut into small pieces in sterile plate
 - Direct examination : KOH preparation, KOH calcofluor stain - REPORT
 - Other common stain in Microbiol lab. : Gram stain, AFB stain - REPORT
 - Histopathology : tissue reaction (H&E, PAS); shape (GMS)
 - Culture : SDA, SDA+abt, SDB, Blood agar 2-3 days, 30&35C
 - Identification: classical (colony & sporulation)/ PCR/ MALDI-TOF
- Serology : Negative GM & BG

PRESENTED AT MMTC CONFERENCE, 1-3 DEC 2017

Pathogenesis of Mucormycosis

Sizes

- 3-11 μm
- >10 μm

- IR: **Steroid**: impair ϕ migration, ingestion. Phagolysosome fusion
- **Hemat. Malignancies: Neutropenia**: impair chemotaxis & diminish fungicidal mechanisms
- **DKA**: weak neutrophil, low pH, higher glucose level, free iron
- Mucorales is **able to extract iron** from desferrioxamine.

Isavuconazole :

- Broad spectrum 2nd gen. triazole
- Inhibit CYP enzyme laosterol 14-alpha-demethylase (CYP51) –blocking synthesis of ergosterol
- Metabolites via CYP3A4 & CYP3A5 which may alter the plasma concentrations
- a moderate inhibitor of CYP3A4, and a mild inhibitor of P-glycoprotein (P-gp), and organic cation transporter 2 (OCT2)

PRESENTED AT IJMTN CONFERENCE, 1-3 DEC 2017
COPYRIGHT OF SPEAKER

Table 1 In vitro activity of isavuconazole against clinically important species of *Aspergillus* and Mucorales (adapted from Ref. [15])

Organism	No. of isolates	MIC range ^a (µg/mL)	MIC ₉₀ range ^a (µg/mL)	MFC range ^a (µg/mL)
<i>Aspergillus</i> species				
<i>A. flavus</i>	97	0.25–16	1–16	0.5–4
<i>A. fumigatus</i>	939	0.06–4	0.5–2	0.125–4
<i>A. nidulans</i>	70	0.06–2	1	NA
<i>A. niger</i>	84	0.125 to >16	2–4	0.25 to >8
<i>A. terreus</i>	222	0.125 to >16	0.5–4	0.25–2
Mucorales				
<i>Cunninghamella</i> spp.	25	0.12 to >8	>8	2 to >16
<i>Lichtheimia</i> spp.	111	0.03 to >8	1 to >8	4 to >16
<i>Mucor circinelloides</i>	16	2–8	8	NA
<i>Mucor</i> spp.	107	<0.015 to >8	2 to >8	2 to >16
<i>Rhizomucor</i> spp.	38	<0.015 to >8	>8	2 to >8
<i>Rhizopus</i> spp.	189	0.12 to >8	1 to >8	1 to >16
<i>Syncephalastrum</i> spp.	2	0.125–4	NA	1–16

NA not available, MFC minimum fungicidal concentration, MIC minimum inhibitory concentration, MIC₉₀ MIC at which 90 % of isolates are inhibited

^a Across individual studies reviewed in Ref. [15]

- Isavuconazole: good *in vitro* activity against *Rhizopus* & *Rhizomucor*
- However, its activity is limited for other Mucorales especially *Mucor circinelloides*
- Overall, MIC of Mucorales higher than *Aspergillus* group

- A 57 year-old Thai man with β -thalassemia disease was admitted (day 0) due to low grade fever and swelling Rt arm & forearm (deep and superficial soft tissue) with rapid progression lesions for -3 months.
- History of planting in a swampy area before lesion occurred.
- **KOH & PAS & GMS** : Non-septate hyphae

What?? and How should we do next??

Yellow tissue covered with pus, measuring 6x11 cm.

- **CTA**: Rt upper extremity: Occluded distal Rt. Brachial artery above the bifurcation.

- ***Pythium insidiosum*** antibody by ELISA: Pos

After 1st debridement (+6 days)

After 2nd debridement (+15 days)

Before discharge (+24 days)

- **Dx**: Pythiosis
- **Tx**: Debridement + oral terbinafine & itraconazole + Immunotherapy

Human pythiosis: *Pythium insidiosum* (fungus-like organism)

Only one case reported in 2011 An American soldier acquired traumatic wound infection by *Pythium aphanidermatum* in Afghanistan (Farmer A et al. J clin Microbiol, 2011)

Blood agar

Corn meal agar

Sabouraud dextrose agar

Sabouraud dextrose broth

Macroscopic: Mycelium like fungi, rapid growing, submerged, white to colorless colony, 35C, 24h

KOH preparation

GMS stain

KOH-Calcofluor white stain

LPCB wet mount

Microscopic: Sparsely rare septate hyphae

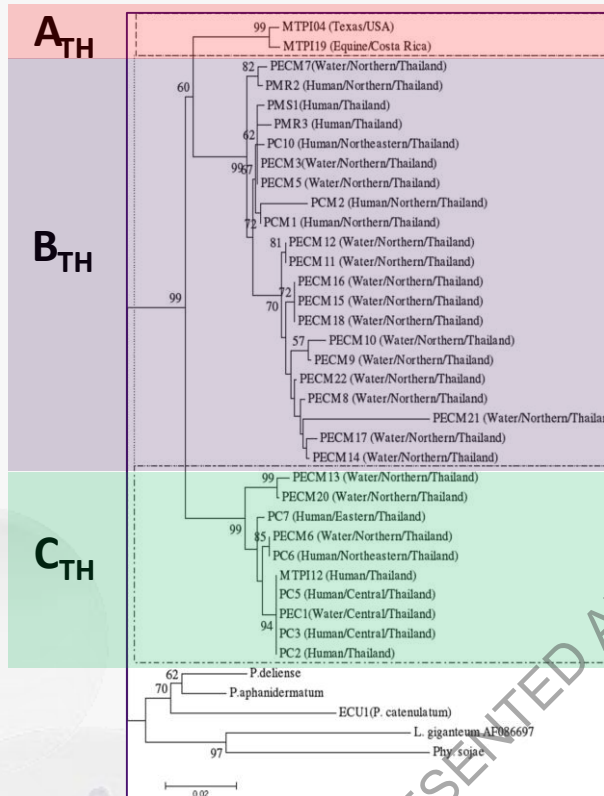

Recent Taxonomy

Keratitis pythiosis

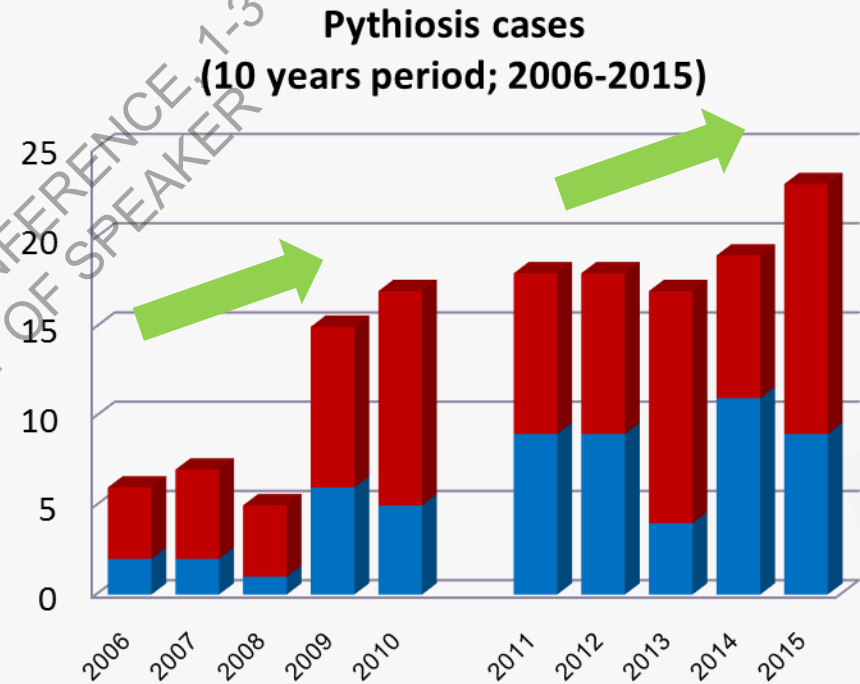

(sub) Cutaneous form

Human Pythiosis

- Human pythiosis was first described in Thailand, in 1987.
- So far Thailand has been ranged as the highest incidence of human pythiosis in the world.

- Base on the immunotherapy requested from Mycology unit, KCMH, the increasing trend was presented.

Human Pythiosis

Pubmed Search (search on 29th Nov 2017)

Keywords	Number of publications		
	Before 2006	2006-present (12 years approx.)	Total

Treatment outcomes of surgery, antifungal therapy and immunotherapy in ocular and vascular human pythiosis: a retrospective study of 18 patients.

Permpalung N¹, Worasilchai N², Plongla R³, Upala S⁴, Sanquankeo A⁴, Paitoonpong L³, Mendoza L⁵, Chindamporn A⁶.

Retrospective study in 18 pythiosis cases in KCMH from 2003 to 2013

Vascular pythiosis; n=9

- 44% of vascular cases died
- Definitive surgery with adequate surgical margins

Ocular pythiosis; n=9

- 55% of ocular pythiosis underwent enucleation.
- Age might be one prognostic factor, significantly younger of non-enucleated cases than those who underwent enucleation.
- Higher non-enucleated cases (45%) was found in our center than others (12-21%), might have been due to the routine administration of PIA in our center.

RAPID and DEFINITE diagnosis + treatment !!
are significant for the patients survived (vascular) and saved globe (ocular).

Int J Low Extrem Wounds, 2015 Sep;14(3):245-50. doi: 10.1177/1534734615599652. Epub 2015 Aug 18.

Vascular Pythiosis of the Lower Extremity in Northern Thailand: Ten Years' Experience.

Reanpang T¹, Orrapin S¹, Orrapin S¹, Arworn S¹, Kattipatanapong T², Srisuwan T², Vanittanakom N³, Lekawanvijit SP⁴, Rerkasem K⁵.

Retrospective study in 22 vascular cases : 10-years period (2004-2014) in Maharaj Nakorn Chiang Mai, Chiang Mai University Hospital.

- Successful management of vascular pythiosis requires early recognition
- 4 classic clinical presentations need to be concerned:
 - (1) underlying thalassemia
 - (2) no atherosclerotic risk
 - (3) history of previous leg wound
 - (4) presentation with acute or chronic limb ischemia

Important to note that “serum antibody for *Pythium* should be tested in all suspected cases before treatment”

- Survival rate was around 63.6%.
- The only effective treatment was complete excision of the infected tissue, which was done mainly by major amputation.
- This report raises awareness of this disease, which needs preemptive diagnosis and appropriate treatment.

One more novel technology can help for pythiosis diagnosis

tHDA-RFLP

Original Article

Original Article

Differential diagnosis for pythiosis using thermophilic helicase DNA amplification and restriction fragment length polymorphism (tHDA-RFLP)

Navaporn Worasilchai¹, Piyasak Chaumpluk², Arunaloke Chakrabarti² and Ariya Chindamporn^{1*}

- Thermophilic helicase DNA Amplification (tHDA) using *P. insidiosum* specific primer
 - Isothermal DNA amplification, no need PCR machine
 - Rapid & accurate, species-specific identification
- Can differentiate *P. insidiosum* from closely related pathogenic fungi by CviKI-1 digestion.
- Limit of Detection :
 - 100 pg (1.74×10^2 copies) for 1-step protocol
 - 100 fg (1.74×10^{-1} copies) for 2-step protocol – add denature step
- Directly amplification in clinical samples was also evaluated.

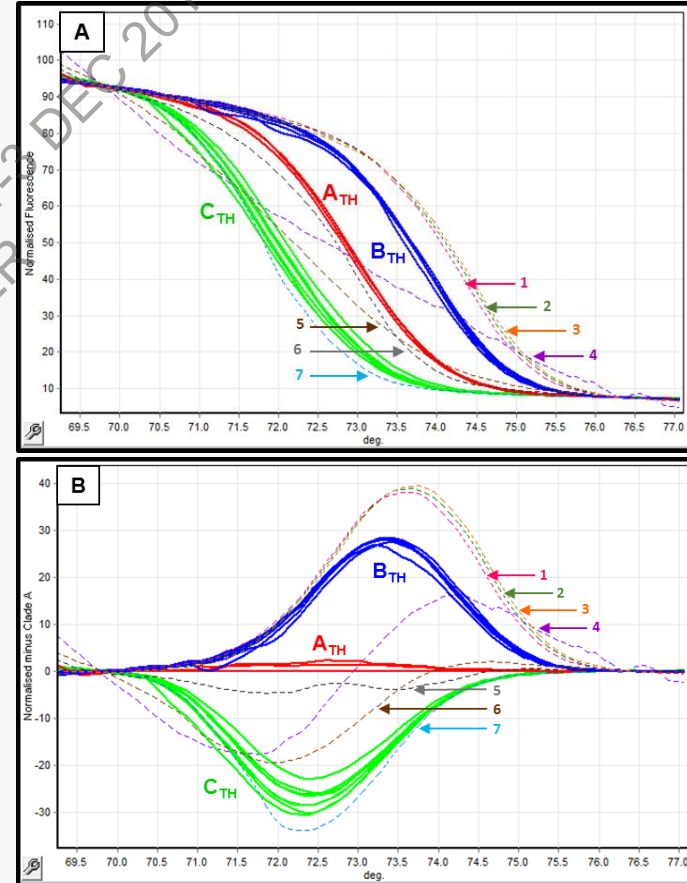

One more novel technology....for clade pythiosis diagnosis

High Resolution Melting Analysis: A Novel Approach for Clade Differentiation in *Pythium insidiosum* and Pythiosis.

HRM

Navaporn Worasilchai, Nitipong Permpalung, Ariya Chindamporn

- Real-time polymerase chain reaction (qPCR) with subsequent High Resolution Melting (HRM) using *P. insidiosum* specific primer
 - No need sequencing step
 - Rapid & accurate, clade-specific identification
- Limit of Detection :
 - 100% specificity
 - 1 pg limit of detection

Worasilchai et al., Med Mycol, 2017

Normalized graph (A) and difference graph (B): comparison among Clade A_{TH}, Clade B_{TH}, and Clade C_{TH} *P. insidiosum* (—) and other related fungi (---) which were amplified COX2 gene:
L. albertoi (1); *P. aphanidermatum* (2); *P. catenulatum* (3); *C. coronatus* (4); *Phy. sojae* (5); *B. meristosporus* (6); *Phy. parasitica* (7)

Mucormycosis

- Underlying dis. in developed country : DM; developing country: HM
- Seems like a clear sky of treatment in future: 2nd triazole
- From translational research of pathogenesis : CoH member -

Guideline for pythiosis diagnosis (Thai patients, experience)

Vascular pythiosis

- Underlying hemoglobinopathy ie. thalassemia, PNH etc.
- Agricultural related occupations ie. farmer or history of water exposure
- Present acute or chronic ischemia with rapid progression
- No atherosclerotic risk & no response to any antifungal agents

Ocular pythiosis

- History of water spilled to the eye
- Present ulcerative keratitis / endophthalmitis with rapid progression
- No response to any antifungal agents

RAPID and DEFINITE diagnosis + treatment !!
are significant for the patients survived (vascular) and saved globe (ocular).

Thank you
